Phase 1: Onboarding & Calibration

The "Setup" phase ensures the tool knows who you are and what you want to achieve.

1. **LinkedIn Authentication:**
    - User installs the extension and clicks **"Sign in with LinkedIn."**
    - This verifies the account and pulls basic profile data (Name/Headline) to save time.
2. **Strategic Goal Setting:**
    - **Global Context Input:** A text area where the user defines their mission.
    - *Example:* "I'm a Marketing Director at Data Pilot. I'm looking to connect with B2B SaaS founders to discuss data automation and partnerships."
    - **Daily Outreach Goal:** User sets a numeric target (e.g., 20 requests/day). The UI provides a "Safety Zone" indicator to help avoid LinkedIn's spam filters.
3. **Default Preference Selection:**
    - User picks their "Signature Tone" (Casual, Professional, or Direct).

Phase 2: In-Situ Profile Intelligence

The tool works silently as the user browses LinkedIn profiles.

1. **Passive Detection:**
    - As a profile loads, the extension identifies:
        - **Degree of Connection** (1st, 2nd, or 3rd).
        - **"Open Profile" Status** (Is a free InMail possible?).
        - **The "Stealth" Scrape:** Grabs Name, Headline, visible About text, and the top Experience entry.
2. **The AI Strategic Badge:**
    - When the user opens the extension, the **Recommendation Engine** displays:
        - **Recommended Channel:** "AI Suggests: Connection Request" or "AI Suggests: InMail."
        - **The "Bridge" Reasoning:** "You both lead marketing teams in Lahore—mentioning local market trends will increase your acceptance rate."

Phase 3: Dynamic Drafting & Format Logic

The UI and AI adapt based on the selected communication channel.

1. **Channel-Specific Interface:**
    - **Connection Request:** One compact text area. Hard-limit logic ensures the AI stays under **300 characters**.
    - **InMail:** Two distinct fields: **Subject Line** (punchy/short) and **Body** (Macro-format with a value prop).
    - **Message:** Conversational, medium-length format for 1st-degree contacts.

2. **The "Bridge" Generation:**
    - The AI synthesizes the **User's Global Context** + **Target's Data** + **Selected Tone** to write the note.
    - **Live Character Counter:** Turns red if the text (AI-generated or user-edited) exceeds LinkedIn's limits.

Phase 4: Execution & Feedback Loop

Closing the loop and tracking progress.

1. **One-Click Copy:**
    - Separate "Copy Subject" and "Copy Message" buttons for InMails.
    - A "Copied!" success toast appears.
2. **Guided Handoff:**
    - A small tooltip reminds the user: "Now click 'Add a note' on LinkedIn and paste."
3. **Progress Tracking (The "Dopamine Hit"):**
    - The **Daily Goal Tracker** updates instantly: 14 / 20 Goal Reached.
    - A progress bar visually fills up.
    - **Success Notification:** Once the goal is hit, a "Goal Achieved!" celebration appears, encouraging the user to stop to stay within "safe" LinkedIn activity limits.

📋 Summary of Format Constraints

Channel	Length	AI Goal
Connection Request	< 300 chars	High-level "Hook" and request to connect.
InMail	Up to 2,000 chars	Subject + Body: Value proposition and clear CTA.
Message	400 - 800 chars	Casual follow-up or specific inquiry for 1st-degree.
